

Energy Storage Systems

If sustainable, quiet energy backup is right for you, Powers Guaranteed Services is ready to install an ESS in your home!

Energy storage systems are designed to collect and store energy for later use. For homes, they are typically comprised of highly efficient batteries, providing hours of standby power. And right now, they qualify for significant tax credits.

WORKS WITH HOME SOLAR PANEL SYSTEMS

During a power outage, a standalone solar array cannot provide usable energy. Adding a battery backup energy storage system allows you to store solar energy for use during an outage.

SUPPLEMENTAL BACKUP POWER

New or existing standby generators can be integrated with some energy storage systems.

UNINTERRUPTED POWER

Unlike a standby generator, where there is a lag between the power going out and the generator powering on, an energy storage system provides immediate, seamless transfer of power during an outage.

SCALABLE POWER

An energy storage system can be customized to suit a range of energy usage needs, from powering a few items to supplying power to the entire house.

TAX SAVINGS

Energy Storage Systems qualify for a 30% tax credit under the Inflation Reduction Act!

EASY ENERGY MONITORING AND MANAGEMENT

Most energy storage systems come with a user-friendly app so you can monitor and manage how power is being stored and consumed.
